**Pest Alert**

**Spotted Lanternfly**

*Lycomia delicatula (WHITE)*

*(Hemiptera: Fulgoridae)*

The Spotted Lanternfly, *Lycomia delicatula* (White), an invasive planthopper, has been discovered in Berks County, Pennsylvania. It is native to China, India, Vietnam, and introduced to Korea where it has become a major pest. This insect attacks many hosts including grapes, apples, stone fruits, and tree of heaven and has the potential to greatly impact the grape, fruit tree, and logging industries. Early detection is vital for the protection of Pennsylvania businesses and agriculture.

**Identification:**

The Spotted Lanternfly adult is approximately 1" long and 1/2" wide at rest. The forewing is grey with black spots and the wings tips are reticulated black blocks outlined in grey (A, B, C). The hind wings have contrasting patches of red and black with a white band (A). The legs and head are black; the abdomen is yellow with broad black bands. Immature stages are black with white spots, and develop red patches as they grow (D,E).

**Hosts:**

In the fall, adults congregate on tree of heaven (*Ailanthus altissima*) (F), willows (*Salix* sp.), and other trees, in groups of up to 20. Egg masses will be laid on medium to large trees, on trunk, branches, and limb bases. After hatching in the spring, nymphs will move off the tree and search out new hosts, including several kinds of agricultural crops. In Korea, it has been reported to attack 65 different species, 25% of which are known to grow in Pennsylvania.

**Signs and Symptoms:**

Trees, such as tree of heaven and willow, will develop weeping wounds. These wounds will leave a greyish or black trail along the trunk (G). This sap will attract other insects to feed, notably wasps and ants. In late fall, adults will lay egg masses on host trees and nearby smooth surfaces like stone, outdoor furniture, vehicles, and structures. Newly laid egg masses have a grey mud-like covering which can take on a dry cracked appearance over time (H). Old egg masses appear as rows of 30-50 brownish seed-like deposits in 4-7 columns on the trunk, roughly an inch long (I).

**What to do:**

If you see egg masses, scrape them off, double bag them and throw them away. You can also place the eggs into alcohol or hand sanitizer to kill them. Please report all destroyed egg masses on our website listed below.

Collect a specimen: Specimens of any life stage can be turned in to the Pennsylvania Department of Agriculture's Entomology lab for verification. Directions for submission are on the reverse side of this alert.

Take a picture: A photograph of any life stage (including egg masses) can be submitted to Badbug@pa.gov.

Report a site: If you can't take a specimen or photograph, call the Automated Invasive Species Report Line at 1-866-253-7189 and leave a message detailing your sighting and contact information.

By: Lawrence Barringer, Entomologist
Pennsylvania Department of Agriculture
ENTOMOLOGY PROGRAM SAMPLE SUBMISSION FORM

The Entomology Program at the Pennsylvania Department of Agriculture can provide identification. Please complete this form to be submitted with the specimen(s).

SPECIMEN REQUIREMENTS:

1. All specimens should be dead.
2. Most specimens should be placed in 70-80% Ethyl or Isopropyl Alcohol in a leak proof vial. *(Moths, Butterflies, and Mealy bugs should be frozen and placed in a hard plastic container with dry paper toweling)*
3. The vial should be placed in a zipper style bag.
4. Specimens from different locations (if applicable) should be placed in different vials.
5. A completed sample submission form must accompany the vial/container.

REQUIRED INFORMATION:

Name of Submitter: ____________________________

Contact Information: Telephone: ____________________________ Email: ____________________________

Address where specimen was collected: ____________________________

Date Collected: ____________________________ Plant Host/Habitat: ____________________________

Name of Person Who Collected Specimen: ____________________________

Comments/Special Instruction: ____________________________

Mail the vial/container and completed form, or deliver in person to:

Pennsylvania Department of Agriculture
Entomology - Room 111
2301 North Cameron Street
Harrisburg, PA 17110

Contact: Sven-Erik Spichiger at 717-772-5229 or Leo Donovan at 717-772-5225

**PEDOMINANT LIFE STAGE PRESENT- (one generation per year in Pennsylvania in 2015 and 2016)**

- eggs
- nymphs
- adults

---

1. Destroying all *Ailanthus* trees (Tree of Heaven) may result in spotted lanternfly moving to surrounding plants and increase the pest pressure on them. It is recommended about 15% of *Ailanthus* trees are left alive to serve as trap trees to attract the spotted lanternflies. Leave only male trees if possible.

2. *Ailanthus* trees will re-sprout vigorously from cut stumps and roots, unless they are treated with a systemic herbicide. Repeat applications of herbicide may be necessary.

3. ALWAYS READ HERBICIDE AND INSECTICIDE LABELS AND FOLLOW THE DIRECTIONS

Treat only a few trees with a systemic product with a systemic product such that the amount of insecticide released into the environment and may help conserve

3. Treat the remaining Alnus glutinosa trees with a systemic insecticide that will move throughout the tree. The insecticide must be applied

Alnus glutinosa trees which may eventually have to be removed.

...
There is a new invasive insect in southeastern Pennsylvania, *Lycorma delicatula*, commonly known as the spotted lanternfly (SLF). This insect can harm grapes, hops, fruit and trees and it is also a nuisance in landscapes. Established populations of SLF are not known to exist anywhere else in North America.

The United States Department of Agriculture (USDA), the Pennsylvania Department of Agriculture (PDA) and residents are trying to reduce populations of this pest and possibly eradicate it. These efforts rely on cooperation from residents, property owners and businesses. Several management options are being used and more are being developed from experimental results.

This article summarizes one management option: placing sticky bands on trees to capture and kill SLF.

SLF are often found moving around on tree trunks. SLF can be captured on the sticky surface of bands placed around trees. This method can effectively destroy many SLF without using insecticides.

Sticky bands are usually placed about 4 feet from the bottom of the tree and may be secured with a push pin. When discarding used sticky bands, some of the SLF that have been captured may still be alive. Double bag or burn the bands to eliminate the possibility of spreading viable SLF.

The stickiness of the type of band you are using will determine how effectively you can catch different life stages of SLF. Less sticky types of bands will capture the younger nymphs, but they will not capture the oldest nymphs or adults as well. Older stages of SLF are strong enough to walk across the less sticky bands without getting stuck and they may actually avoid the bands.

One drawback of using sticky bands is that they can capture other creatures. Other insects are often captured and some of them may be beneficial insects. Occasionally a bird, small mammal or other animal has been captured. Users must understand that this possibility exists.

There are several types of sticky bands:

**PDA volunteer program bands:** The PDA has been using sticky bands made with brown paper. In 2018, the PDA will supply sticky bands to residents who participate in their official volunteer program, as supplies allow. Volunteers must live in the quarantined area. To see the current map go to: [http://www.agriculture.pa.gov/Plants_Land_Water/PlantIndustry/Entomology/spotted_lanternfly/quarantine/Documents/Lycorma%20Quarantine%20Map%20(Statewide%20View).pdf](http://www.agriculture.pa.gov/Plants_Land_Water/PlantIndustry/Entomology/spotted_lanternfly/quarantine/Documents/Lycorma%20Quarantine%20Map%20(Statewide%20View).pdf). PDA volunteers will band only *Ailanthus altissima* (Tree of Heaven). They must change
the bands every two weeks and report the number of SLF captured into the PDA database. If you are interested in participating in the official PDA volunteer program, send your contact information to: aciccareone@pa.gov (please include your name, phone numbers, mailing address and the municipality of the property.) Potential volunteers will be contacted and receive information about upcoming training opportunities.

Commercially available bands: If you do not want to be an official volunteer in the PDA program or you are interested in using sticky bands to kill SLF on trees other than *Ailanthus altissima*, you can purchase a variety of types of sticky bands from several commercial sources. There is also a commercially available band that configures the sticky side of the band as an inward facing surface which reduces the potential of catching birds and other animals. Other companies offer a roll of tree wrap and a sticky substance to spread onto the wrap.

**Tree bands you can make:** You can wrap several widths of duct tape around a tree trunk and coat it with a sticky substance such as petroleum jelly. Petroleum jelly can discolor the bark of trees, and can even injure the bark of young trees, so avoid getting it on the bark. For more information see the article at: https://fyi.uwex.edu/gyspsymothinwisconsin/making-a-sticky-barrier-band/

By using sticky bands, people who care for trees are able to capture and kill many SLF, especially in their early nymphal stages. This is one method that can reduce SLF populations in the infested area. Sticky bands are also useful to monitor for SLF in areas where it has not been found.

For more information about the SLF go to:

Checklist for Residents
Living in Spotted Lanternfly Quarantine Areas

IMPORTANT: Before you move outdoor items from the quarantine area, check for spotted lanternfly egg masses, adults, and nymphs. Make sure all items are pest free before you move them. Help keep this pest from spreading.

If you find any of these life stages of the Spotted Lanternfly, remove, devitalize, place in a sealed bag, and dispose of bag in the garbage.

![Adult Spotted Lanternfly, present in autumn months.](image)

![Fresh Spotted Lanternfly egg mass (outlined in red). Egg masses are present in autumn and winter months, blending in with their surroundings.](image)

![Spotted Lanternfly nymphs, present in spring and summer months. (Images from Park et al. 2009)](image)

By signing this checklist, I am confirming that I have inspected my vehicle and those items I am moving from the Spotted Lanternfly quarantine area, and do not see any egg masses or insects in or on anything I am moving.
